Git Bash guide for IS403 R11 Group 5

Use Git Bash on Windows. Run each command on its own line. Git saves changes locally; GitHub shares them with the team. Full explanations are in docs/git_bash_guide.md.

First use

git clone https://github.com/Dingglebell/is403-maritime-port-forecasting.git

cd is403-maritime-port-forecasting

git config user.name "Your Name"

git config user.email "YOUR_GITHUB_NOREPLY_EMAIL"

Replace the identity values. If using the prepared Project folder, skip clone and cd. Accept your collaborator invitation before pushing.

Bash command	Purpose
pwd / ls / ls -a	Show your folder / list files / include hidden files
cd docs / cd ..	Enter docs / go up one folder
cat README.md	Read a text file
mkdir practice	Create a folder
cp FILE COPY / mv OLD NEW	Copy / rename or move a file

Daily workflow

git switch main

git pull --ff-only origin main

git switch -c task1-han-data-audit

Edit your file, then run git status and git diff.

git add "docs/Task 1_Han.md"

git diff --staged

git commit -m "Clarify the zero cargo audit"

git push -u origin task1-han-data-audit

Use your own task branch and filename. For an existing branch, use git switch BRANCH_NAME without -c. Quotes protect paths with spaces.

Review and finish

On GitHub, open Compare & pull request into main. Describe the change and checks; ask a teammate to review, then merge. With a clean working tree, run git switch main and git pull --ff-only origin main. Start the next change on a new branch.

Quick recovery

Wrong file staged: git restore --staged "file" keeps your edits. If a push fails or a merge conflicts, stop and follow the full guide with the other author. Avoid force-push and destructive reset commands. Raw data is ignored; add only reviewed files.
